

Attorney Docket No. 10559-362001  
Application No. 09/734,333  
Amendment dated May 7, 2004  
Reply to Office Action dated January 15, 2004

Amendments to the Specification:

Please replace the paragraph beginning at page 1, line 4  
with the following amended paragraph:

Jini (TM) Jini™ is an established specification which allows application services to announce their availability dynamically. Users of services can dynamically find an application service using Jini™. Examples can include services providing freight rates, stock quotes, price inventory levels for products or modules (e.g., calculators) for applications. Jini (TM) Jini™ operates by registering services, and responding to client inquiries about one of these services. Jini (TM) Jini™ also provides proxy code to the client allowing the client to communicate with the services. In this way, Jini (TM) Jini™ acts as a broker between the client and the existing services.

Attorney Docket No. 10559-362001  
Application No. 09/734,333  
Amendment dated May 7, 2004  
Reply to Office Action dated January 15, 2004

Please replace the paragraph beginning at page 1, line 15  
with the following amended paragraph:

~~Jini (TM) Jini~~™ has been written in a way such that it can  
only be used by services written in Java™. Many non-Java™  
services ("legacy" services), however exist. These services  
cannot operate through ~~Jini (TM) Jini~~™.

Please replace the paragraph beginning at page 2, line 1  
with the following amended paragraph:

Figure 1 shows an operation of the bridge of the present  
system, forming an interface between non Java services and a  
~~Jini (TM) Jini~~™ broker;

Please replace the paragraph beginning at page 2, line 5  
with the following amended paragraph:

Figures 3A and 3B show[[s]] an example of encapsulating  
CORBA component.

Please replace the paragraph beginning at page 2, line 9  
with the following amended paragraph:

The present application defines a bridge between non Java™  
services and a client which is requesting such services. More

Amendment dated May 7, 2004  
Reply to Office Action dated January 15, 2004

specifically, the bridge provides a code generator to generate a proxy code that wraps the non-Java™ object, and hence enables communication between the client and the service. A surrogate object publishes information about the service and proxy. The surrogate object maintains this information using the ~~Jini~~ (TM) Jini™ protocol. In this way, ~~Jini~~ (TM) Jini™ can be used in its normal way, but can be used as a broker for non-Java™ services. Jini™ stores the code, by indexing the code directly, or by indexing proxy code.

Please replace the paragraph beginning at page 2, line 20 with the following amended paragraph:

The current ~~Jini~~ (TM) Jini™ interface will register services which have a Java™ Application Programming Interface ("API"). Services without a Java™ API cannot be registered with ~~Jini~~ (TM) Jini™. While the present application specifically describes using ~~Jini~~ (TM) Jini™, it should be understood that any service requiring a Java™ API could be similarly used.

Please replace the paragraph beginning at page 3, line 3 with the following amended paragraph:

Attorney Docket No. 10559-362001  
Application No. 09/734,333  
Amendment dated May 7, 2004  
Reply to Office Action dated January 15, 2004

The operation is shown in figure 1. A Java™ service normally publishes itself or its proxy to Jini™, Jini™, along with a set of search attributes that can be used by services that are searching among the services. According to the present system, a non Java™ service 100 is published, using a Java™ compliant "wrapper", as described. The wrapper acts like Java proxy code, and points to the non Java™ service, in the same way that Java™ proxy code would point to the Java™ service.

Please replace the paragraph beginning at page 3, line 11 with the following amended paragraph:

A GUI (Graphical User Interface) allows a user to point and click the location of a service interface file representing the non-Java™ component, here an ActiveX component. For example, this may be an OCX file for an activeX component 100 as shown in figure 1. The point and click operation is used to instruct the bridge 110 to publish the service.

Please replace the paragraph beginning at page 4, line 3 with the following amended paragraph:

At 230, this system forms middle tier tunneling proxy code 140 to form a bridge between the client and the service. Other

Reply to Office Action dated January 15, 2004

information obtained from introspection at 210 is used to generate search attributes. These form keywords which are used to supplement the keyword repository in Jini (TM) Jini™. In addition to the keywords identified by introspection, a user may also specify additional keywords in the Graphical User Interface (GUI).

Please replace the paragraph beginning at page 4, line 11 with the following amended paragraph:

Jini (TM) Jini™ stores the proxy objects and a set of search attribute objects shown as 152, 154, shown in figure 1.

Please replace the paragraph beginning at page 4, line 13 with the following amended paragraph:

The Jini (TM) Jini™ service is shown as 150. A client, or a service-proxy for the client, makes a call to the backend service wrapper object. The wrapper object redirects the call to the actual Component Object Model ("COM") or CORBA component. Each time such a call is made, the bridge 110 generates code that redirects the calls to the service 100. The generated code may be Java™ proxy code.

Attorney Docket No. 10559-362001  
Application No. 09/734,333  
Amendment dated May 7, 2004  
Reply to Office Action dated January 15, 2004

Please replace the paragraph beginning at page 4, line 19  
with the following amended paragraph:

At 260, the bridge receives a ~~Jini~~ (TM) Jini™ lease object based on the successful registration of the ~~Jini~~ (TM) Jini™ object. The lease object shown as 142 keeps the object definition up-to-date. The bridge renews the lease from time to time, thereby insuring up-to-date information in ~~Jini~~ (TM) Jini™.

Please replace the paragraph beginning at page 5, line 1  
with the following amended paragraph:

A service is published to ~~Jini~~ (TM) Jini™ in the following way. First, the service is serialized as a Java™ object, if it can be so serialized. Other, non Java™ compliant services are packaged as described above. Services which are incapable of being serialized into ~~Jini~~ (TM) Jini™ may publish their proxies instead. Constraints such as heaviness, native dependability, and the like may prevent the service from directly publishing to ~~Jini~~ (TM) Jini™. The proxy is a serializable lightweight Java™ object that acts as the service delegate. The proxies act as middle tiered objects allowing access of services on the back end. The object or proxy is sent to ~~Jini~~ (TM) Jini™, along with

a set of search attributes. Once the Java™ objects have been transported to ~~Jini~~ (TM) Jini™, they are delivered to clients responsive to notifications of service matches.

Please replace the paragraph beginning at page 5, line 15 with the following amended paragraph:

Another aspect is to allow publishing either Jini™ or non Jini™ services. Any service that is capable of serialized in itself, and publishing itself to ~~Jini~~ (TM) Jini™, would do so directly. This enables clients to directly use the service objects.

Please replace the paragraph beginning at page 5, line 20 with the following amended paragraph:

Non ~~Jini~~ (TM) Jini™ services may not have a proxy, or such a proxy may need to be generated as part of the ~~Jini~~ (TM) Jini™ registration process.

Please replace the paragraph beginning at page 6, line 4 with the following amended paragraph:

As an example of operation, figure 3 shows how the system could publish and obtain different information. A service 300,

Reply to Office Action dated January 15, 2004

e.g., a CORBA service is coupled to the code generator 305 which provides an wrapper around the CORBA shown as 310. Once in the wrapper, the CORBA code appears to the broker or proxy as Java™ code, i.e., it is no different like any other Java™ application. At 315, the application is published with the ~~Jini~~ (TM) Jini™ broker. Figure 3B, shows a client, which is a non Java™ client such as an Excel (TM) client asking for services. At 330, the request for services is also placed in a wrapper at 335 and placed to ~~Jini~~ (TM) Jini™. ~~Jini~~ (TM) Jini™ returns the request.
